

### **POLIGRAT equips Marienplatz in Munich**

After 40 years of intensive use the subway floor “Marienplatz” is extensively renovated and receives over the next three years a completely new and modern face.

Especially moisture and aggressive road salt residue have caused damages to the building. In addition to the restoration of the basic fabric and the fire protection facilities, the complete replacement of flooring, furniture, technology, wall and ceiling covering takes place.

In the new wall covering POLIGRAT has a significant share. POLIGRAT equips here the selected Stainless Steel facing with a so called **POLIANT-coating**, a coating that is characterised by an **Anti-Graffiti** and **Anti-Fingerprint** effect and in addition also has an **Easy-to-Clean** property, which ensures a reduction of cleaning costs by up to 70% to the operator. Moreover a **better Corrosion Resistance** can be achieved.

Our coating meets both the current building approval as well as the fire protection and is able – apart from the above mentioned advantages – to take also your building project to a long lasting and high class result.
